Awesome Job [See All Jobs](#)

You probably know that you can [add your own code snippets](#) in Xcode 4.

Those snippets are stored in

`~/Library/Developer/Xcode/UserData/CodeSnippets`.

You can create a symlink in your Dropbox folder to keep your snippets backed up and synced with your other computers:

```
ln -s ~/Library/Developer/Xcode/UserData/Code
```

(replace `~/Dropbox/` with your actual Dropbox folder location)

This way you should always restart Xcode if you modify snippet. There is a much better way to manage and sync snippets in Xcode. It is Snippets [http://snippets.m](http://snippets.m...)
<http://www.youtube.com/watch?v=0qzsVhKqOHw>. You can edit and manage your code snippets in Snippets, sync between your computers and using Snippets Distributor for Xcode push them to the Xcode without needing to restart it.
